OVERVIEW

Over the past two years, the traditional enterprise has been turned inside out. With remote work established and hybrid work taking shape, organizations will need an always-connected defensive posture to remain secure against the business risks remote users may introduce. In addition, recent geopolitical unrest is causing new security and risk trends, highlighting ongoing strategic shifts in the cybersecurity ecosystem. These crises are expected to have a broad industry impact and significant potential for threat actors.

Most organizations recognize vendor consolidation as an avenue for more efficient security, with many navigating this path. And consolidation, while challenging, is achievable today. More streamlined operations and reduced risk are viable, and Malwarebytes delivers with better-integrated solutions that predicate operational efficiency.

Organizations need simple and effective protection from nefarious actors. Malwarebytes’ DNS Filtering module extends our cloud-based Nebula security platform to provide web protection that keeps your end users safe and productive. This builds on the protection against internet attacks already provided in the platform’s prevention capabilities, such as brute force protection and anomaly detection.

Employing website and content filtering capabilities as part of an endpoint protection solution helps keep your digital ecosystem safe and further protect your business, providing many benefits:

• Blocks connections to malicious web servers attempting to deliver malware payloads to your system
• Protects users from falling for a phishing attempt by blocking their access to the malicious website
• Restricts employees from website categories, such as social media, gambling, or shopping that may decrease productivity

You can easily block website and content to align internet access with your organization’s cybersecurity or code of conduct policies.

PREVENT THREATS FROM ONLINE ACTIVITY

Keep web-based threats and online content from wreaking havoc on your organization. With Malwarebytes DNS Filtering, you can manage access to whole categories of websites (e.g., gambling, adult content, etc.) while also maintaining controls to tailor access that meets your organization’s specific requirements for security and compliance.

By default, DNS queries are in plaintext, making them susceptible to interception and misdirection. Our module use DNS over HTTPS (DoH) protocols to encrypt and protect your DNS queries, allowing you to hide DNS from attackers and third parties.

---

Malwarebytes DNS Filtering module gives your IT and security teams the control and flexibility to manage and secure internet use to mitigate your organization’s exposure to internet-originated threats. And if malicious content sneaks into your environment, Malwarebytes’ real-time protection capabilities have your back, helping you detect and respond to suspicious content.

NEW MALWAREBYTES USERS CAN DEPLOY THE DNS FILTERING MODULE AT THE SAME TIME AS DEPLOYING THE MALWAREBYTES PLATFORM. THE PLATFORM STANDS UP WITHIN A DAY, ENABLING YOU TO REALIZE SECURITY IMPROVEMENTS ON DAY ONE.

NEBULA SECURITY PLATFORM

When it comes to managing endpoint protection, organizations need a simple solution that relieves constrained IT and security resources by offering visibility into prioritized vulnerabilities and emerging threats. Malwarebytes DNS Filtering module is built to extend our cloud-based Nebula security platform, making it easy to manage all your Malwarebytes solutions from a single platform: Malwarebytes Incident Response (IR), Endpoint Protection (EP), and Endpoint Detection and Response (EDR).

MALWAREBYTES DNS FILTERING: YOUR SAFEST CHOICE

• Gain a single, unified platform for endpoint protection and web content filtering
• Insulate browser and web app interactions against threats
• Allow exceptions, backed by real-time protection against malicious downloads
• Understand activity for website exceptions, blocked sites, and potential DDoS attacks
• Encrypt DNS traffic to protect against leaked domain information
• Safeguard against threat actors that create false web domains
• Deploy easily in under a day and add modules immediately

DEPLOY QUICKLY AND EASILY

Current Malwarebytes business customers can instantly add the DNS Filtering module to the existing instance of Malwarebytes EDR, EP, IR, or server solutions. As with other Malwarebytes modules for Nebula—like our Vulnerability and Patch Management modules, activation simply appears within the menu, so it’s simple to employ safer web content policies directly from the same Malwarebytes console you already trust for protection and remediation.
